

Medical Poem

Acute post streptococcal glomerulonephritis

Sanjeev Narang

Department of Pathology, Index Medical College Hospital and Research Centre, Indore, Madhya Pradesh, India

- Follows streptococci after one to two weeks
Patients between six and sixteen it seeks.
- Beta hemolytic streptococci, culprits main
Into glomeruli, a hold they gain.
- Antibodies like ASO, AHase, Askase abound
Elevated titers are invariably found.
- Enlarged are kidneys in a symmetrical manner
Hemorrhages cortical, give it a flea bitten "banner."
- Enlarged and hypercellular glomeruli are present
Proliferative and exudative activity they represent.
- "Humps" are deposits electron dense
Seen on epithelial side of the fence.
- With Immunofluorescence, study them you do
Composed they are of IgG and C3 too.
